

On the difference in DA with and without multipole errors

A.Valishev with input from S.Fartoukh and
M.Giovannozzi

October 3, 2014

SLHCV3.1b (not HLLHC yet!)

$\beta^*=15\text{cm}$, $590\ \mu\text{rad}$, $N_p=2.2\text{E}11$

full crab at IP1,5, collision at IR8

Not baseline! – worst case scenario

Errors change nonlinear coupling

As=0, no errors

As=0, with errors

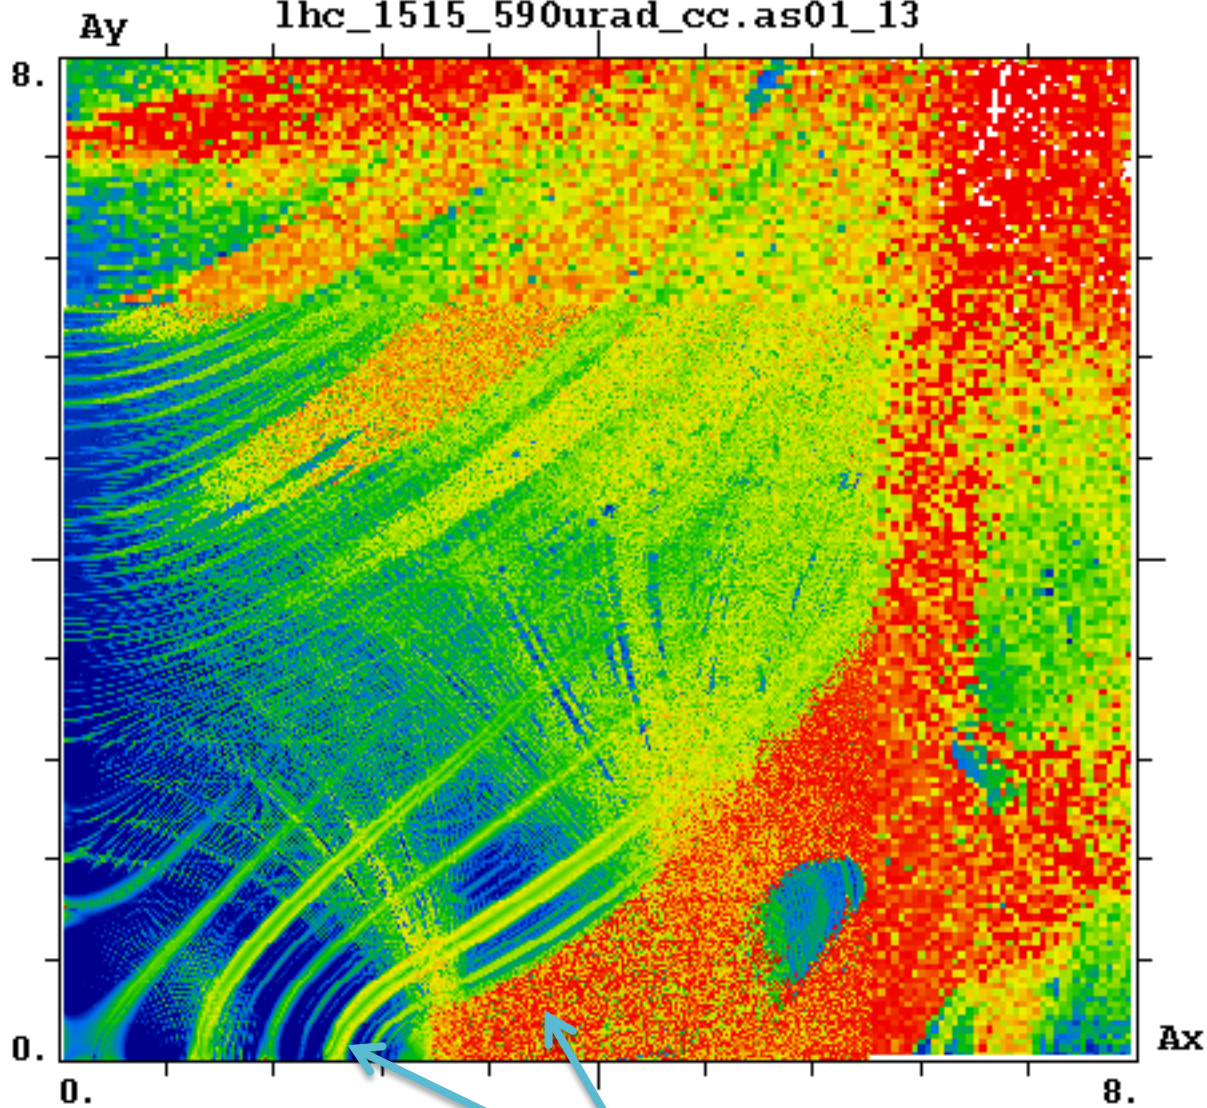

10th order

13th order

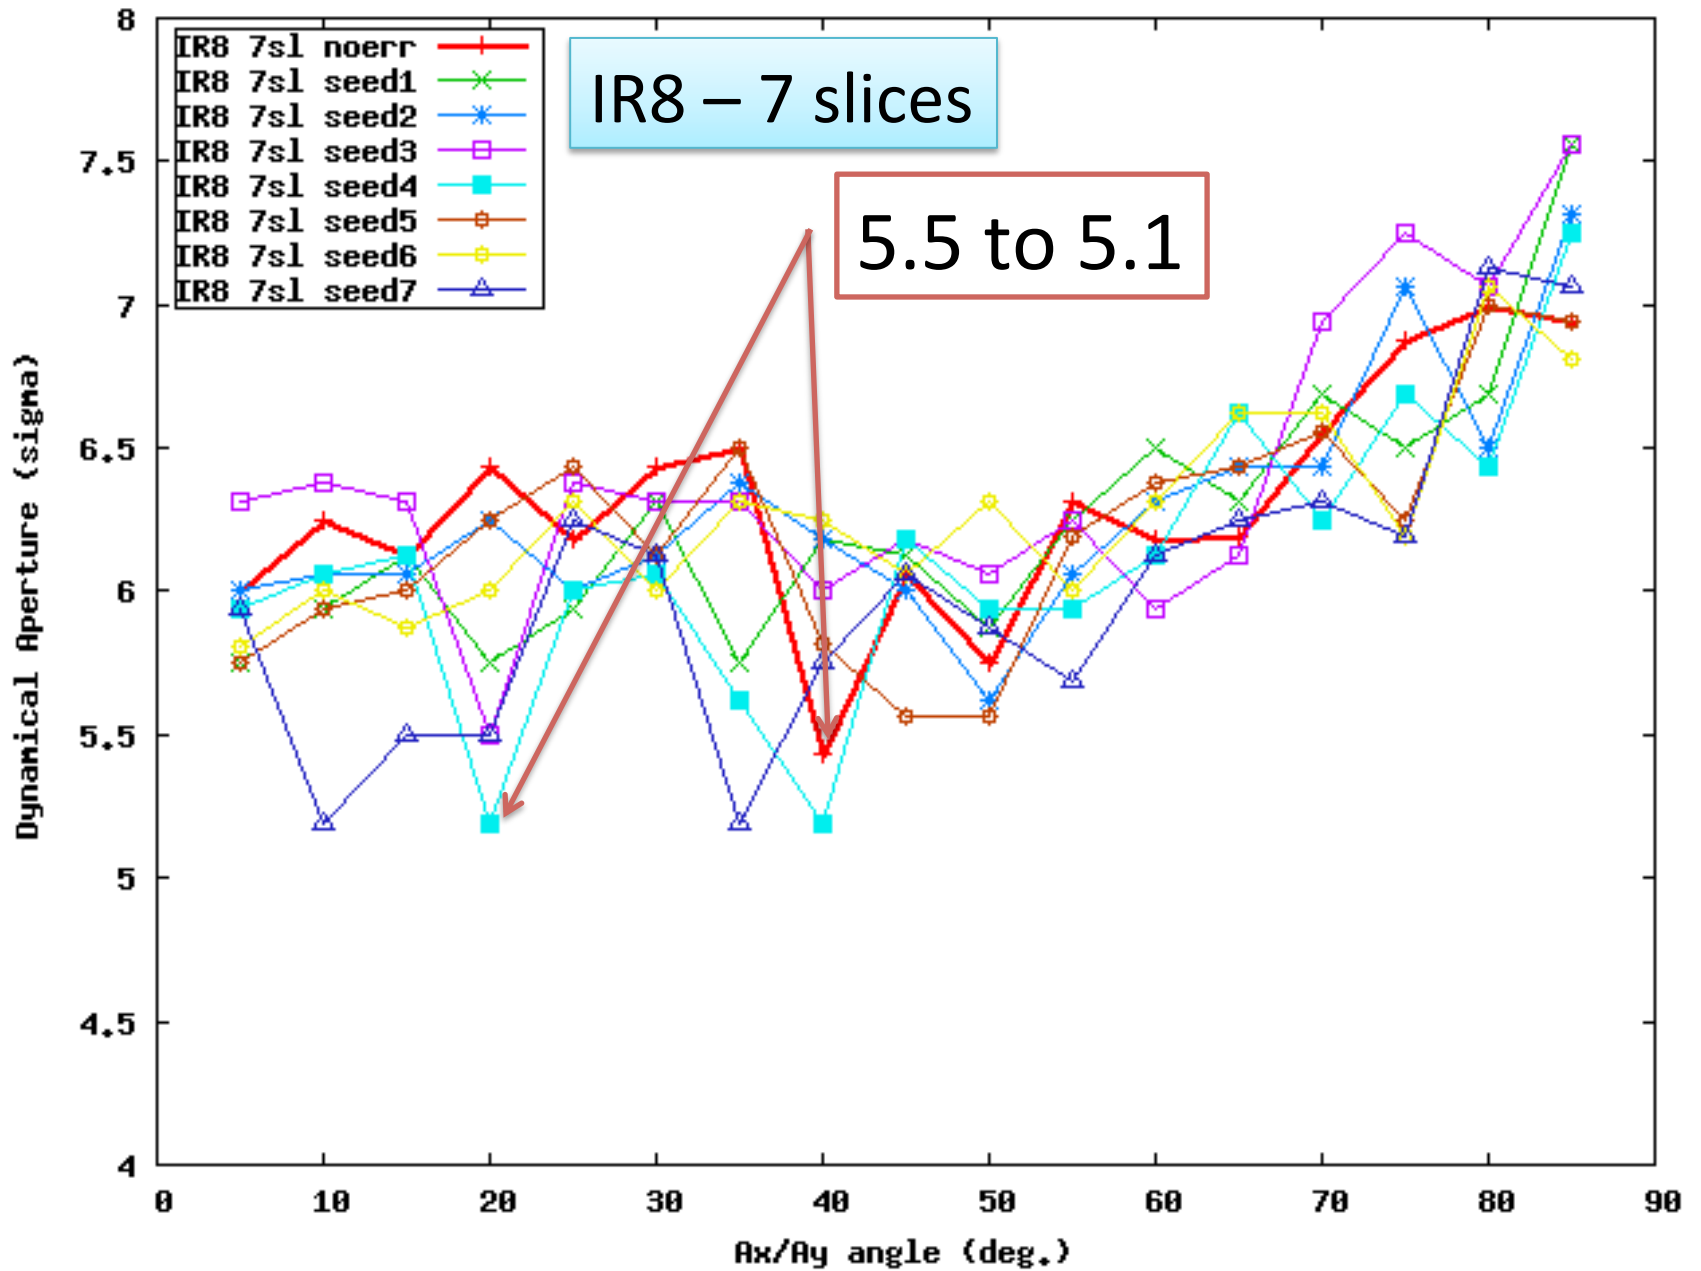

Coupling $Q_x - Q_y = n$

As=1, no errors

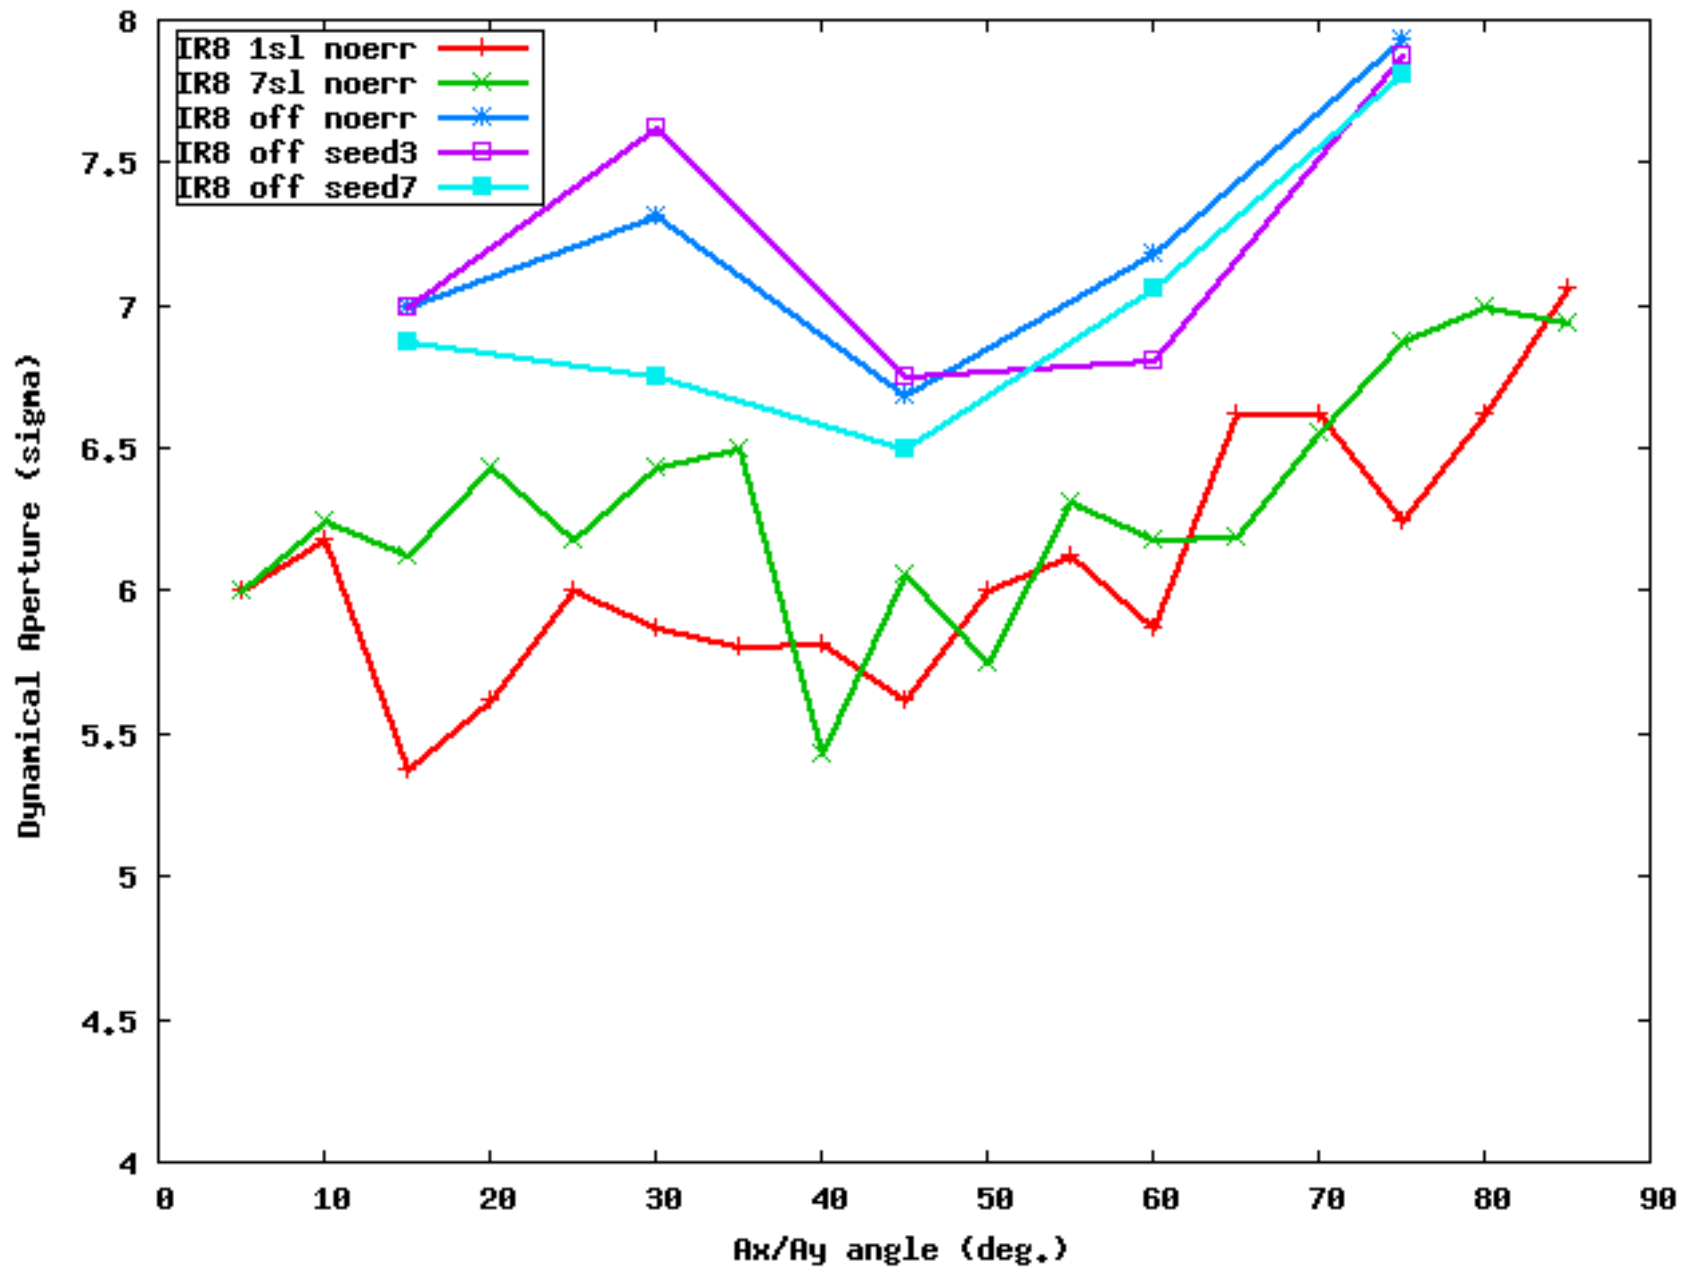

lhc_1515_590urad_cc.as01_13

SBR Coupling $Q_x - Q_y - m \times Q_s = n$

Effect of IR8

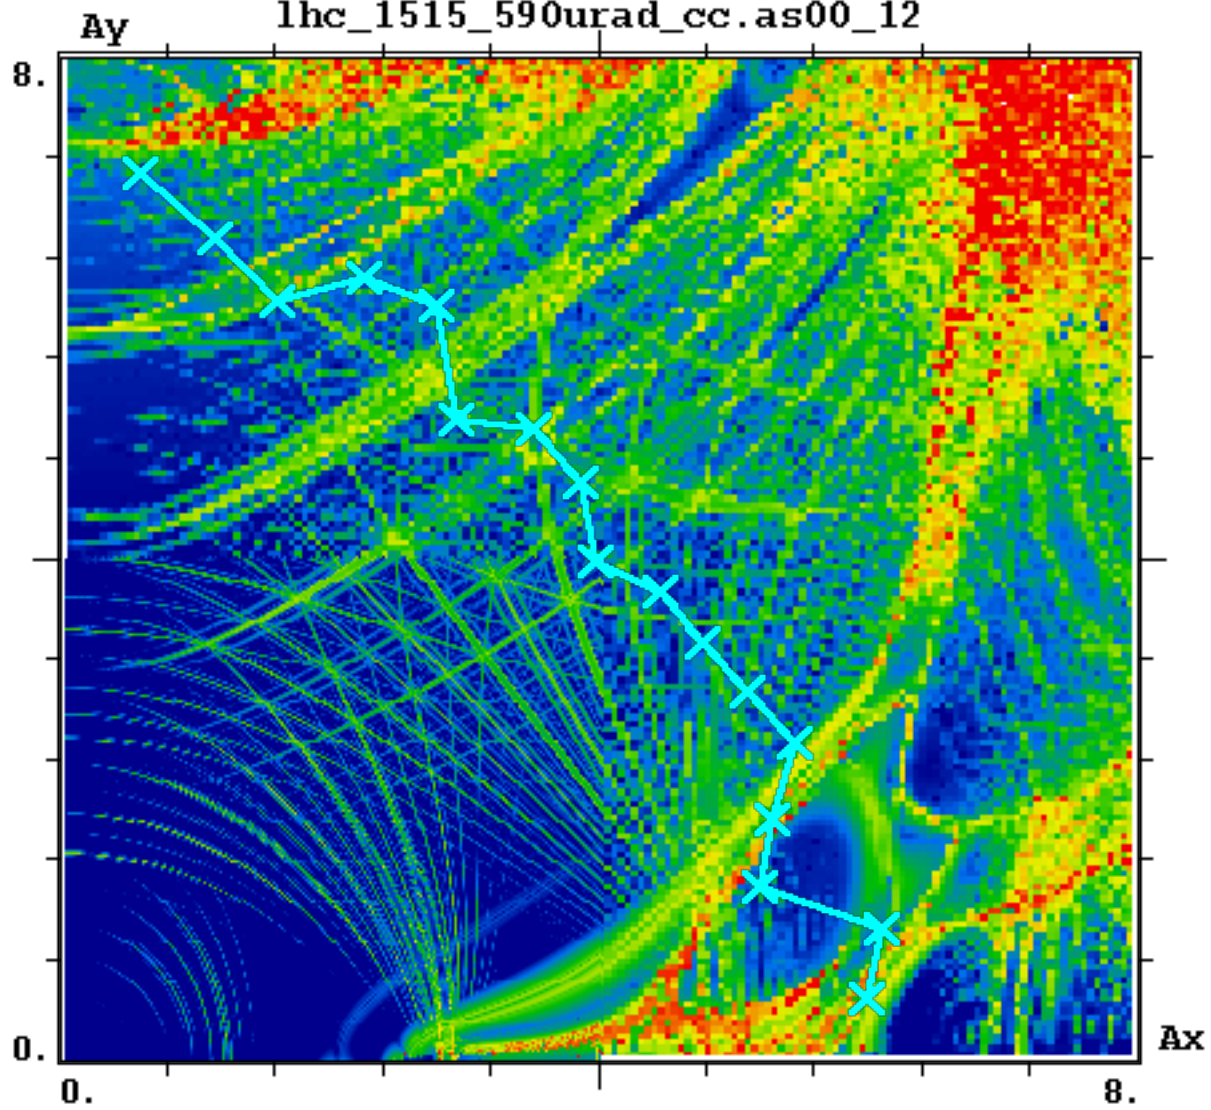

Conclusions

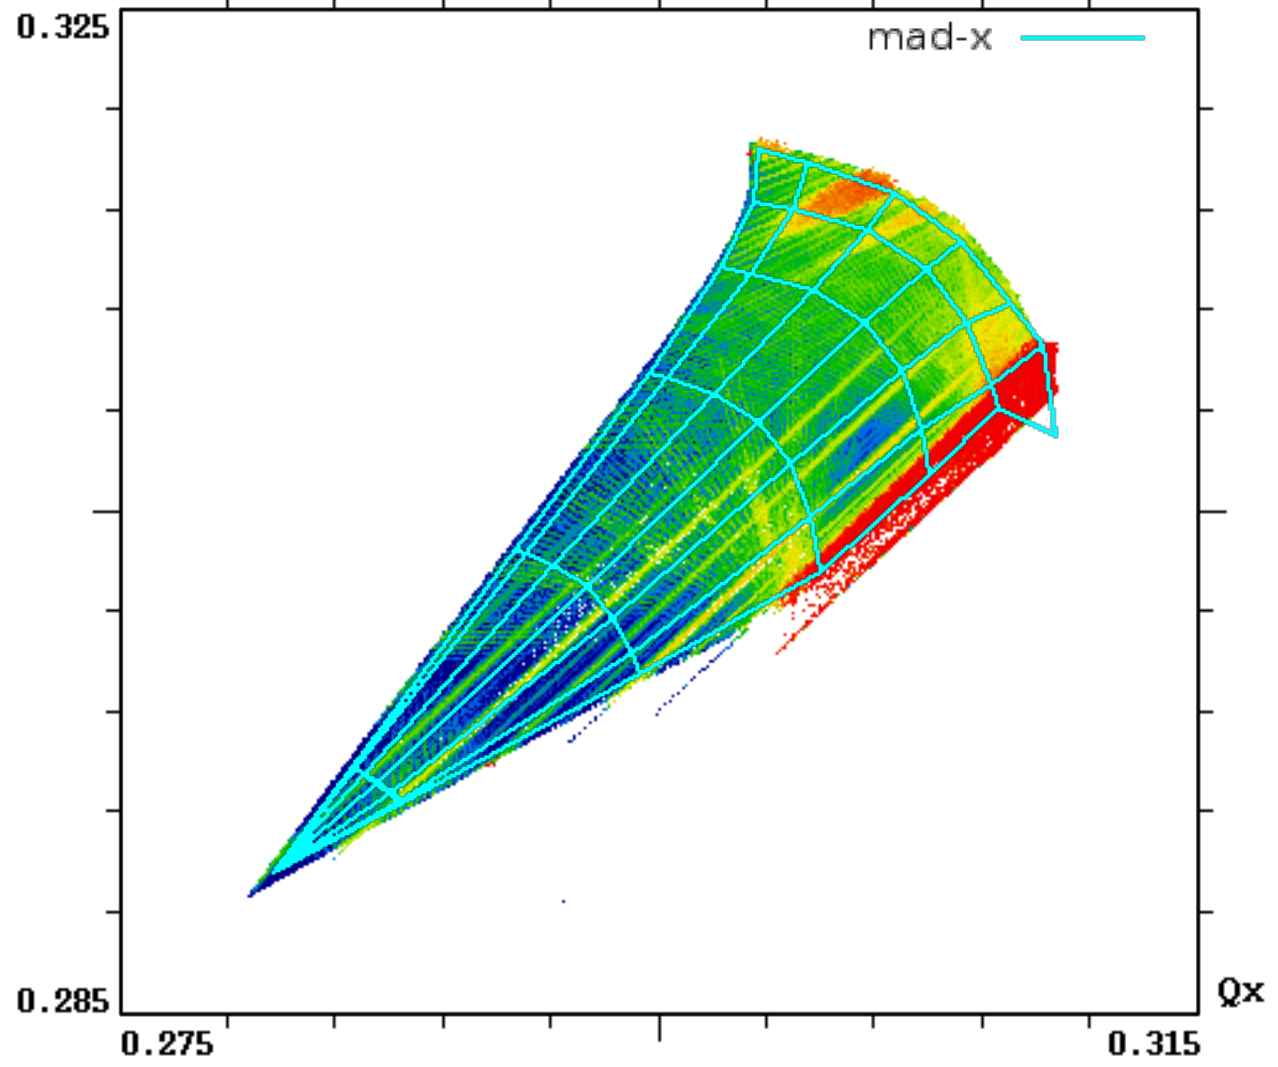

- It is important to use the number of slices in IR8 >1
 - Despite small σ_z/β^*
 - Crossing angle is significant
- The worst-worst-case scenario is marginally acceptable without/with errors with respect to DA
- However, overlapping resonances will enhance diffusion \rightarrow bad emittance and luminosity lifetime
- To be confirmed for HLLHCv1

As=0, no errors

lhc_1515_590urad_cc.as00_12

lhc_1515_590urad_cc_IR8-7sl.as01_13

As=1, no errors, IR8 7 slices
