

Status of multi-turn particle debris tracking

R. Bruce, F. Cerutti, A. Marsili, S. Redaelli

Outline

- Introduction
- Creating the new inputs distributions
 - Distributions of transverse kicks and energy changes due to collisions (FLUKA)
 - Initial distributions without collision
 - New initial distributions with effect of collisions
- Preliminary results of tracking
 - 4 TeV nominal
 - 4 TeV, TCL @14 σ
- Conclusion

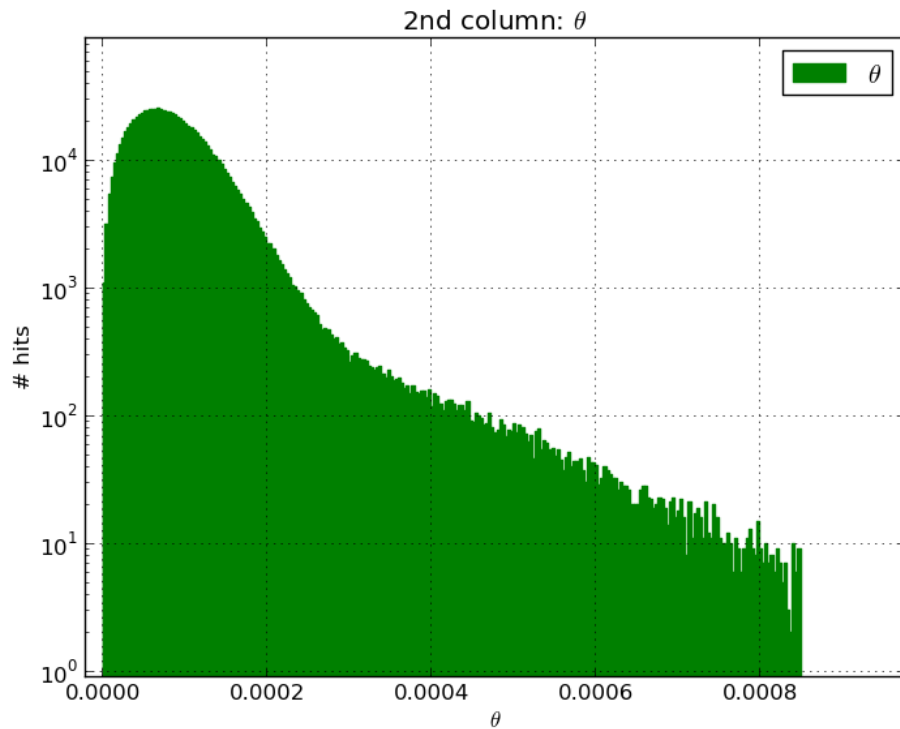

Introduction

- **Goal:** study the losses due to debris from IPs (instead of regular beam losses) by tracking them around the ring
- This talk focuses on the setup of the tools: inputs & results are still preliminary
 - Further iterations needed (cuts, elastic contributions...)
- Two effects of the collisions:
 - Shift in momentum
 - Extra kicks: x' , y'
- Distributions courtesy of F. Cerutti
- Presented during **CoLUSM3**

- Distributions of θ and dp/p from FLUKA.
- Only inelastic contributions
- $x' = \tan(\theta)\sin(\varphi)$
- $y' = \tan(\theta)\cos(\varphi)$ $\varphi \in [0 ; 2\pi]$
- 4 TeV:
 - Distribution of θ is cut at the opening of the TAS
 - Distribution of dp/p is cut at 0.1

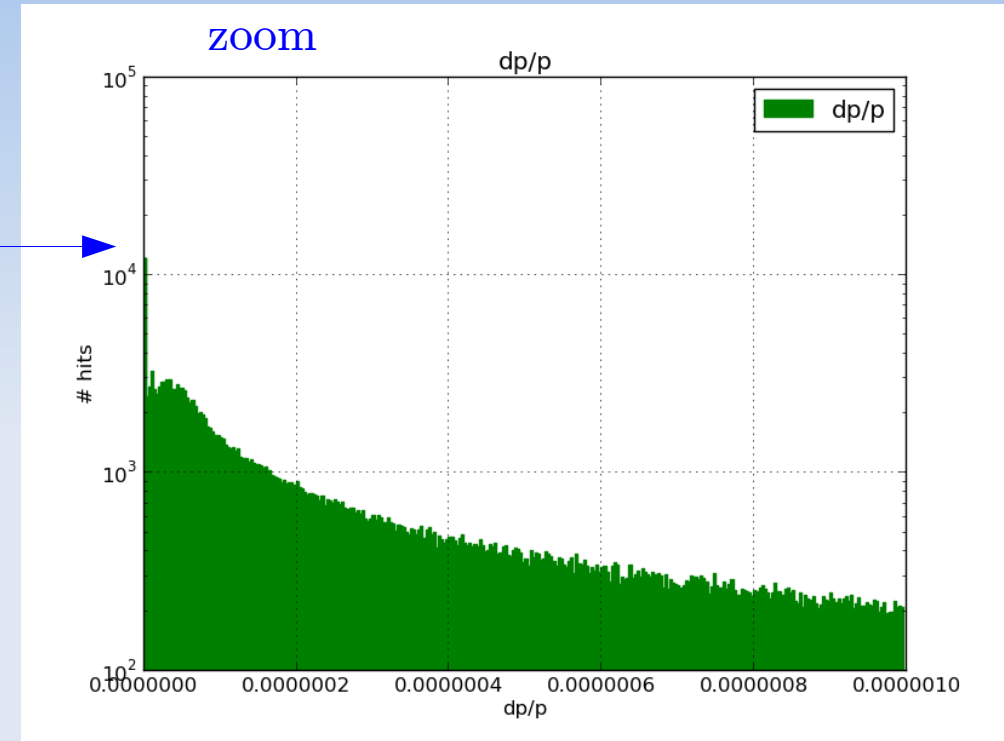

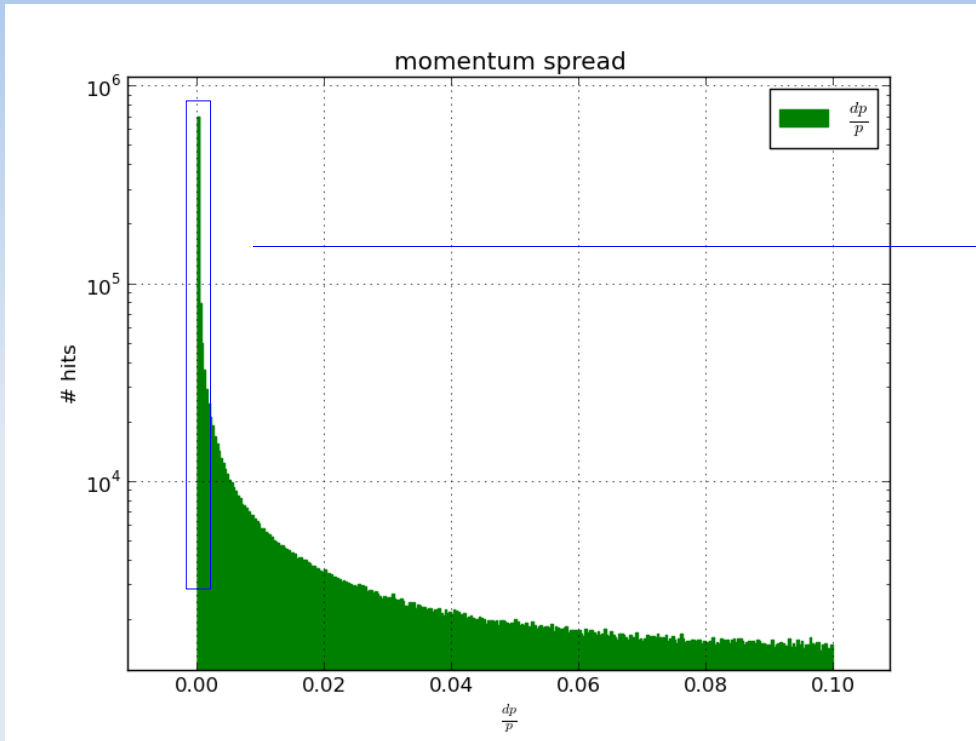

around 0

around π

- Notice the effect of the cut
- Distributions for colliding protons coming from opposite directions can be folded to double the statistics

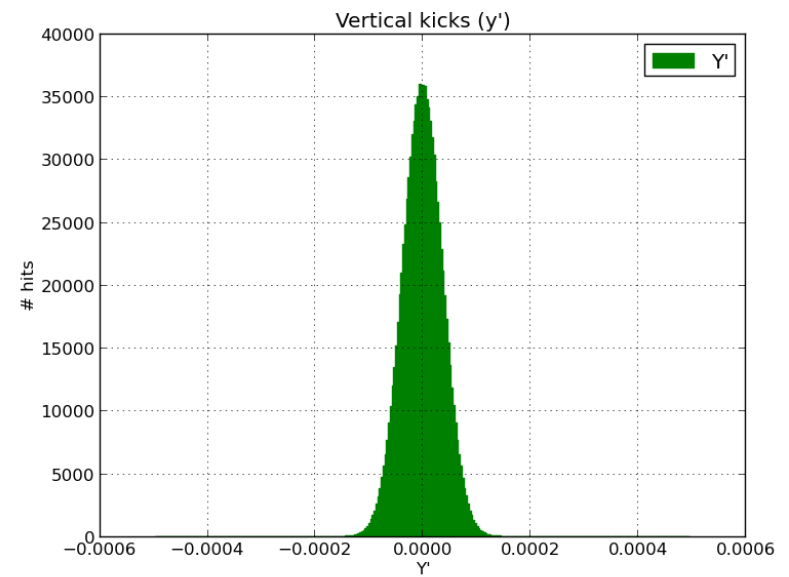

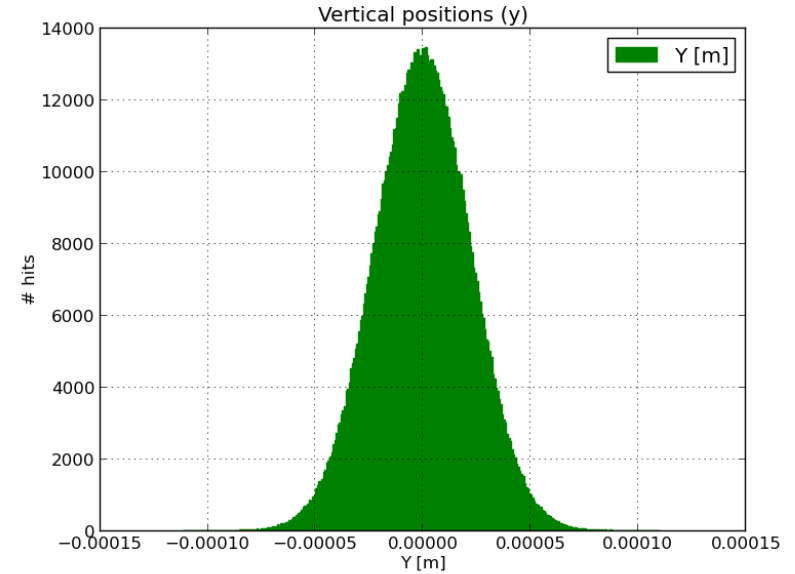

Distribution of dp/p (4 TeV)

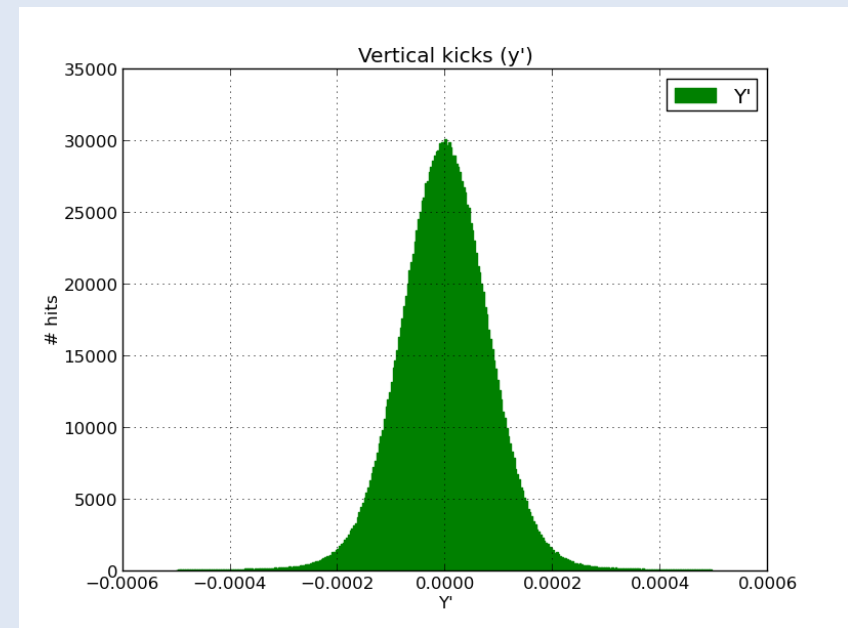

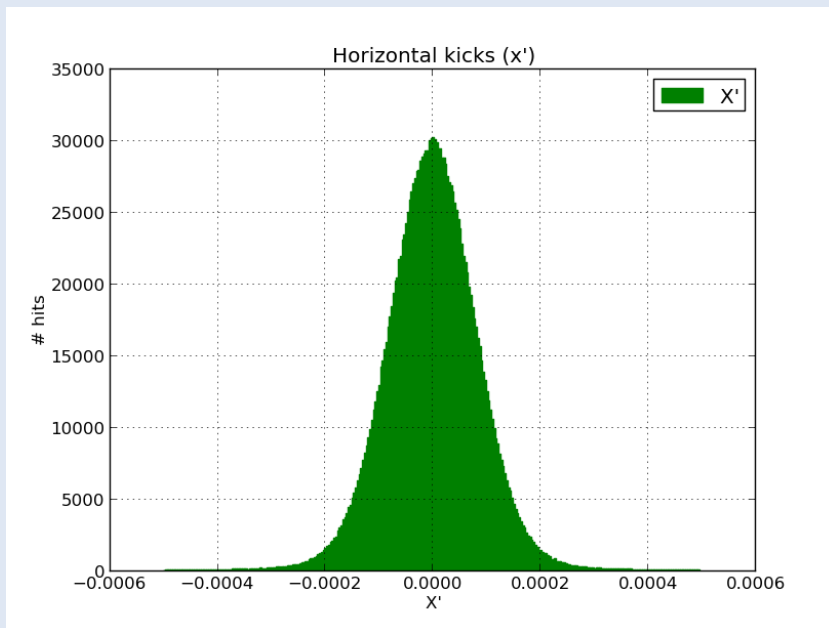

- p with higher θ or dp/p would be lost anyway during tracking.
- Some combinations of both could make particles above cut survive the TAS anyway.

Initial distributions no collision

- Sums of the initial distributions + shifts induced by the collisions (same scale)
- The effect of collisions is larger

Simulation pre-processing

- Distributions are generated for simple p-p collisions
- FLUKA gives $\delta x'$, $\delta y'$, dp/p
- For a non-perturbed initial distribution, we have the 6 coordinates: x , x' , y , y' , l , E
- We sum the two:
 x , $x' + \delta x'$, y , $y' + \delta y'$, l , $E(1 - dp/p)$
- The crossing angle is added by SixTrack
(that's why the distributions are centered around 0)
- Then: standard tracking

Tracking results

Particle tracking

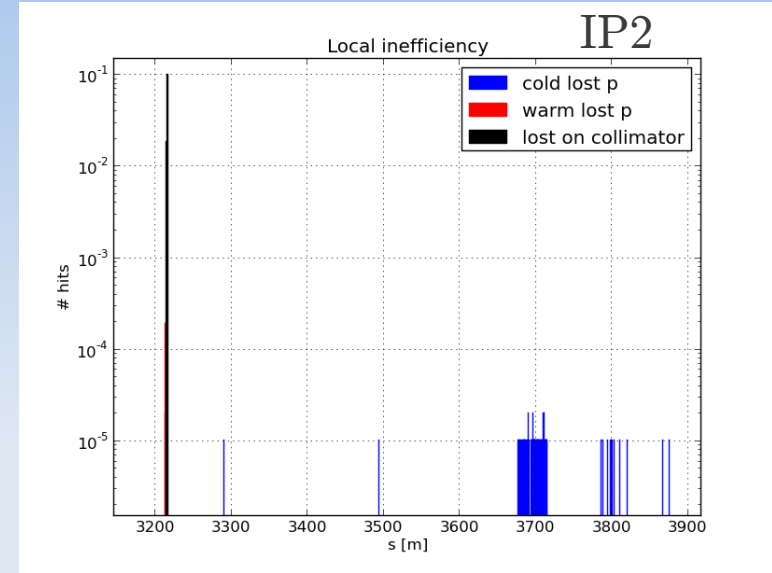

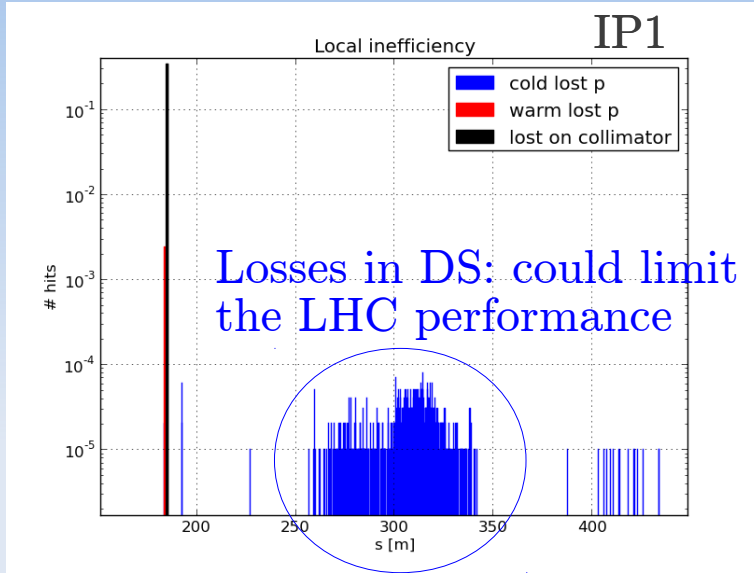

- Not all particles are perturbed, but we track only particles that are perturbed
- With the present cuts at 4 TeV (TAS aperture, 0.1 dp/p), 17.7 % of the particles are given.
- If we'd track all particles, most of the non-disturbed particles would not be lost over 200 turns
(Remember that for usual multi-turn tracking, only the halo is generated)

- Particles tracked from IP1
- Most losses at TCL.5R1.B1 (nominal: @ 10σ)
- Specific loss locations outside collimators
- /!\ this is inefficiency
- /!\ preliminary results

Loss map (zooms)

- This is our goal; \neq preliminary results
(rest of loss map is wrong...)
- More losses downstream of TCL when out
- Next step: full scan $10 \sigma \rightarrow 60 \sigma$

Conclusion

- Simulation setup for physics is running well.
- We have not yet physical results because the focus was on the technical aspects.
- Outlook:
 - Get physical results
 - Calibrate losses in physical units
 - Update FLUKA inputs (cuts, elastic interaction)
 - Reproduce losses measured during TCL scans
 - Setup tracking simulations starting at other IPs.
- Final goal: having reliable tools to study LS2 layout (next two months)
